Can old wires cause a breaker trip? If you plug in modern appliances, you might experience frequent breaker trips due to circuit overload. Old aluminum wires might melt when the circuit overloads. The melting cables might burn the plastic casing, causing a fire. If you check the insulation in one of your outdated wires, you might find it deteriorating. What happens if a circuit breaker trips? The breaker will trip if it detects that the current exceeds the circuit's capacity. Often, a circuit overload happens if you've plugged multiple appliances, including high-power devices, into the circuit. You might notice that power goes out in your kitchen or living room when the breaker trips. Why do you need a circuit breaker? Your circuit breakers protect your home from electrical issues by cutting off the flow of electricity through a circuit whenever the electrical current gets too high and unsafe. Without circuit breakers, electrical fires, shocks, and other forms of damage and injury would occur much more often. How do you reset a circuit breaker? To reset your circuit breaker, turn off the breaker by moving the switch or handle to the "off" position. Then, turn it back on. For safety, it's a good idea to stand back from, or to the side of, the panel, just in case any sparks come from the breaker when it's moved. You might even consider wearing safety goggles to protect your eyes.
