The developed energy storage supply chain contains four nodes: battery, PV power providers, energy storage businesses, and EV producers. What is China's energy storage supply chain?China has made vast investments in the entire energy storage supply chain, from raw material extraction to manufacturing energy storage technologies and EVs. China controls the global supply of critical raw materials for battery production, such as lithium, cobalt, and graphite (Olivetti et al.,). What is the energy storage supply chain?The developed energy storage supply chain contains four nodes: battery, PV power providers, energy storage businesses, and EV producers. The model discovered the ideal combination of these nodes and achieved its objectives, including cost savings, risk management, quality improvement, technological innovation, and sustainability goals. Does the HRES model improve the reliability of the energy storage system?The results suggest that the model effectively enhances the reliability of the HRES and RO system and reduces environmental impacts. The model reduced the loss in power supply by 18.3 % and provided accurate forecasts for power supply and demand, which enhanced the productivity of the energy storage supply chain for HRES. How can energy carriers improve the energy storage supply chain?Reduce the LCOE of the energy carrier supply chain while maintaining the optimal supply chain structure and functionality. Renewable energy storage supply chain improved when hydrogen, ammonia, and methanol were used as energy carriers. Hydrogen is more cost-effective for short-term storage, while ammonia is for extended storage periods.
