Which energy storage technology has the most power in the world? PHEs was the dominant storage technology in 2015, accounting for 97.45% of the world's cumulative installed energy storage power in terms of the total power rating (176.5 GW for PHEs). The deployment of other storage technologies increased to 15,300 MWh in 2015. In the electricity energy market, independent energy storage stations, due to their charging and discharging characteristics, can purchase electricity at a lower price as demanders during low grid load periods, and operate the stored power as suppliers during peak grid load periods. In the electricity energy market, independent energy storage stations, due to their charging and discharging characteristics, can purchase electricity at a lower price as demanders during low grid load periods, and operate the stored power as suppliers during peak grid load periods. Based on the lifecycle assessment method and techno-economic theories, the costs and benefits of various new energy storage technologies are compared and analyzed. This study aims to provide rational suggestions and incentive policies to enhance the technological maturity and economic feasibility. Aiming at the problems of unclear service scope, high investment cost, long payback period, and low utilization rate faced by the construction of new energy storage, an energy storage planning method considering the comprehensive benefits of independent energy storage is proposed. First, the key It is difficult for independent energy storage to recover costs by only participating in the spot electricity market. Participation in both the spot and frequency regulation ancillary service markets will become a future trend. Due to the coupling of the two markets, independent energy-storage This article establishes a full life cycle cost and benefit model for independent energy storage power stations based on relevant policies, current status of the power system, and trading
