What is distributed energy system (DG)? DG is regarded to be a promising solution for addressing the global energy challenges. DG systems or distributed energy systems (DES) offer several advantages over centralized energy systems. DESs are highly supported by the global renewable energy drive as most DESs especially in off-grid applications are renewables-based. What factors determine the optimal size and location of an energy storage system? In this regard, most research studies consider parameters such as energy storage efficiency, life cycle, reliability indices, network dynamics among other parameters to formulate the optimal size and location of an energy storage system. What is a distributed energy system? Distributed energy systems are an integral part of the sustainable energy transition. DES avoid/minimize transmission and distribution setup, thus saving on cost and losses. DES can be typically classified into three categories: grid connectivity, application-level, and load type. Why do we need distributed energy systems? It particularly studied DES in terms of types, technological features, application domains, policy landscape, and the faced challenges and prospective solutions. Distributed energy systems are an integral part of the sustainable energy transition. DES avoid/minimize transmission and distribution setup, thus saving on cost and losses. Are distributed energy systems better than centralized energy systems? Distributed energy systems offer better efficiency, flexibility, and economy as compared to centralized generation systems. Given its advantages, the decentralization of the energy sector through distributed energy systems is regarded as one of the key dimensions of the 21st-century energy transition . What is a distributed energy resource? Distributed energy resources (DERs) are proliferating on power systems, offering utilities new means of supporting objectives related to distribution grid operations, end-customer value, and market participation. The sustainable energy transition taking place in the 21st century requires a major revamping of the energy sector. Improvements are required not only in terms of the resources and technologies used for power
