The vast majority of electric vehicle owners currently charge their cars at home at night. However, a new study finds this might gravely burden the grid as more EVs hit the road. Instead, a much better strategy in the future is a greater emphasis on daytime charging, scientists say. The number of. For most drivers, there is no need to charge their electric vehicles (EVs) every night. While charging every night may seem like a convenient way to make sure your EV is ready to hit the road, it can lead to unnecessary energy consumption, higher electric bills, and perhaps even shortening the life. Most EV charging happens at night, when cars are sitting idle, and there are many benefits to that. Drivers wake up to a "full tank" and most utility companies offer cheaper time of use energy plans to incentivize usage when demand is lowest. This has worked well so far: EV drivers save money. UK electricity rates during standard hours can be as high as 27p/kWh, but night rates with dedicated EV tariffs drop to as low as 6.7p/kWh. The difference was staggering - I was paying four times more than I needed to for every charge. When I calculated the annual savings, it came to roughly £489.
