What's new in energy storage safety? Since the publication of the first Energy Storage Safety Strategic Plan in , there have been introductions of new technologies, new use cases, and new codes, standards, regulations, and testing methods. Additionally, failures in deployed energy storage systems (ESS) have led to new emergency response best practices. What are non-electrochemical energy storage deployments? Summary of non-electrochemical energy storage deployments. Pumped hydro storage plants store and generate energy by moving water between two reservoirs at different elevations. Water is pumped into an upper reservoir for charging and then released through pipes into turbines for discharging. What is a typical energy storage deployment? A typical energy storage deployment will consist of multiple project phases, including (1) planning (project initiation, development, and design activities), (2) procurement, (3) construction, (4) acceptance testing (i.e., commissioning), (5) operations and maintenance, and (6) decommissioning. How to develop a hybrid energy storage system? Another method of developing hybrid storage systems is to combine batteries with different chemistries. Such hybrid systems are particularly promising for long duration energy storage in grid applications. Pb-acid batteries are extensively used for their low capital cost and wide availability. How can a fast charging/discharging system benefit from long-term energy storage? Technologies that are complementary in terms of energy and power density are often combined to leverage the benefits of fast charging/discharging with long duration energy storage. Some relevant demonstration and deployment projects include integrating batteries with supercapacitors or flywheels. Can energy storage be used as a temporary source of power? However, energy storage is increasingly being used in new applications such as support for EV charging stations and home back-up systems. Additionally, many jurisdictions are seeing increasing use of EVs and mobile energy storage systems which are moved around to be used as a temporary source of power.
