In a recent issue of *Angewandte Chemie*, Chen et al. proposed a new concept of spatiotemporal phase change materials with high supercooling to realize long-duration storage and intelligent release of latent heat, inspiring the design of advanced solar thermal fuels. Phase change materials (PCMs) represent a pivotal class of substances that store and release thermal energy through reversible transitions between solid and liquid states. Their ability to absorb or release large quantities of latent heat at nearly constant temperatures makes them ideal for thermal energy storage.
