Do Island power systems have centrally managed storage facilities? Centrally managed storage facilities in island power systems dominate the relevant literature. Table 4 includes the papers dealing with the centrally managed storage concept. Table S2 of the Supplementary data and Fig. 7 present additional details for the most representative ones. How important are energy storage stations in Nii? Undoubtedly, energy storage stations (ESS) are vital for the electricity sector of NII to move to penetrations of renewables over 50 %. As can be inferred from Table 1, pumped hydro storage (PHS) and battery energy storage (BES) technologies dominate the landscape of actual grid-scale applications for island systems. What are the best storage technologies for Islands??n , batteries and pumped-hydro storage have been identified as the leading storage technologies for islands, with the former effectively applicable to small and medium size system and the latter to large systems with natural reservoirs. Can small island systems operate effectively under high res penetration levels? Specifically, the research team of [60, 175, 176] argues that the small island systems can operate effectively under high RES penetration levels either by deploying battery energy storages to alleviate RES variations or by imposing the diesel generators to operate below their technical minimum loading levels, down to zero, to perform the same task. Does storage contribute to resource adequacy in Islands? Significant research has also been conducted on the dynamic behavior of island systems in the presence of storage and the feasibility of storage investments. On the other hand, the contribution of storage to resource adequacy in islands has received limited investigation, presenting opportunities for further research in this area. Can pumped hydro storage facilitate renewable penetration in Islands? In , the hybridization of wind generation with the introduction of pumped hydro storage systems is investigated. The findings indicate that these integrated storage and RES facilities have the potential to facilitate increased renewable penetration levels in islands without compromising system stability.
