In the 1950s, flywheel-powered buses, known as gyrobuses, were used in Yverdon (Switzerland) and Ghent (Belgium) and there is ongoing research to make flywheel systems that are smaller, lighter, cheaper and have a greater capacity. It is hoped that flywheel systems can replace conventional chemical batteries for mobile applications, such as for electric vehicles. Proposed flywheel energy storage system works like a mechanical battery, but without the lithium-ion drama. When the bus brakes, kinetic energy spins this carbon fiber disc up to 60,000 RPM - that's faster than a Formula 1 engine! Need acceleration? Volvo's flywheel energy storage system works like a mechanical battery, but without the lithium-ion drama. When the bus brakes, kinetic energy spins this carbon fiber disc up to 60,000 RPM - that's faster than a Formula 1 engine! Need acceleration? Flywheel energy storage (FES) works by spinning a rotor (flywheel) and maintaining the energy in the system as rotational energy. When energy is extracted from the system, the flywheel's rotational speed is reduced as a consequence of the principle of conservation of energy; adding energy to the system increases its rotational speed. The Volvo system, with its carbon-fiber flywheel energy recovery and storage system, has also been created to meet low mass targets. It could play a significant role in engine downsizing, giving a four-cylinder unit the signature of a six-cylinder, particularly with regard to pull-away performance. Volvo Car Group has completed extensive testing of kinetic flywheel technology on public roads - and the results confirm that this is a light, cheap and very eco-efficient solution.
