Is hydrogen energy supply chain planning suitable for energy system planning? Abstract: Most planning of the traditional hydrogen energy supply chain (HSC) focuses on the storage and transportation links between production and consumption ends. It ignores the energy flows and interactions between each link, making it unsuitable for energy system planning analysis. Can intertemporal long-term hydrogen storage solve energy imbalance? Abstract: To address the persistent imbalance between energy supply and demand in integrated energy systems, a power-hydrogen and power-gas interchange system involving intertemporal long-term hydrogen storage is proposed. How can geological hydrogen storage be integrated into national energy strategies? Embed geological hydrogen storage - both salt cavern and porous rock - into national hydrogen energy transition strategies. This includes setting clear capacity targets, timely How should industrial engagement with geological hydrogen storage projects be considered? and geological compatibility Industrial engagement with geological hydrogen storage projects is recommended to prioritise rock types with low reactive mineral content to minimise risk of gas loss or contamination sign of storage infrastructure must consider potential material degradation from hydrogen exposure, especially What is hydrogen energy storage? Hydrogen energy storage (HS) is a large-scale and long-term form of energy storage . When combined with hydrogen transportation, it allows for the optimal allocation of energy across geographical and seasonal boundaries.
