Can a compact intermediate-energy storage ring light source fill the gap? In this paper, we follow this trend, and propose a compact intermediate-energy storage ring light source to fill the gap between the third-generation light sources, SSRF and HLS-II, and the fourth-generation light sources (HEPS and HALF) in China, to meet most of the requests from the materials research users in SZLab. Why do we need a co-optimized energy storage system? The need to co-optimize storage with other elements of the electricity system, coupled with uncertain climate change impacts on demand and supply, necessitate advances in analytical tools to reliably and efficiently plan, operate, and regulate power systems of the future. Why is energy storage important? Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible. What is the future of energy storage? Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change. What does the European Commission say about energy storage? In March, the European Commission published a series of recommendations on energy storage, outlining policy actions that would help ensure greater deployment of electricity storage in the European Union. Will battery energy storage investment hit a record high in 2024? After solid growth in 2023, battery energy storage investment is expected to hit another record high and exceed USD 35 billion in 2024, based on the existing pipeline of projects and new capacity targets set by governments.
