Do thermal power units participate in peak regulation auxiliary services? Owing to China's energy structure, thermal power accounts for nearly half of the country's installed power generation capacity. Although the willingness of thermal power units to participate in peak regulation auxiliary services is low, we propose a peak regulation cost compensation and capacity-proportional allocation mechanism. Should auxiliary services be compensated for peak regulation in China? The standard compensation system of auxiliary services for peak regulation in China's power market still requires improvement, and the supporting policies require further strengthening.

(3) It should be pointed out that the proposed model still needs to test its operability through practice. Can Shapley values be used to calculate peak regulation costs? Ye et al. (), Wu et al. () used Shapley values to calculate peak regulation costs for different entities. Wu et al. (), Jiang et al. () calculated the allocation of peak regulation electricity for wind farms based on the "equal power quantity-following the load" method. What is the user compensation fee for shiftable and sheddable load? In the IDR, the user compensation fee for the shiftable and sheddable load was 140 yuan/ (MWh), and the parameter settings are shown in Table 5 and Table 6 (Hou et al., 2022b).

FIGURE 3. Wind power, photovoltaic power generation, and load curves. FIGURE 4. Electricity price of power grid and users. TABLE 4. Price elasticity matrix of demand. What is the difference between photovoltaic peak regulation and wind power profit? The wind power profit and photovoltaic peak regulation are composed of the profit from electricity sales, the allocation cost, and the penalty for abandoning wind and light. The thermal power peak regulation profit is composed of compensation, allocation, and DPR costs. These are shown in Eqs. 7 - 9. Does peak regulation affect benefit allocation? In research on the economic dispatch of power systems considering peak regulation initiatives, the issue of benefit allocation among various peak regulation entities is involved. As thermal power plants (TP) shift to auxiliary roles, their profitability diminishes, while energy storage systems (ESS) offer flexibility and rapid response to stabilize supply-demand imbalances. However, ESS adoption has been hindered by weak cost recovery mechanisms. This mechanism comprehensively considers the source-load initiative. From the source side, it encourages entities to participate in peak regulation, and the restriction of the peak regulation initiative is set. Among them, paid one-time FM compensation, new energy storage the compensation standard is 400 yuan/MWhr. The extra costs in keeping up with the peak demand are passed to the customers in form of a power fee, i.e. you pay for your maximum peak. I take the same example but the maximum demand is for energy storage systems.
