What are energy storage system costs? Energy storage system costs are often represented by a set of metrics, including upfront capital cost (often normalized to \$/kW or \$/kWh), fixed ongoing costs, variable ongoing costs, and end of life costs rather than a single metric. Charging costs may be left to the value analysis later. Which energy storage technologies are included in the cost and performance assessment? The Cost and Performance Assessment provided installed costs for six energy storage technologies: lithium-ion (Li-ion) batteries, lead-acid batteries, vanadium redox flow batteries, pumped storage hydro, compressed-air energy storage, and hydrogen energy storage. What is multi-energy storage performance? Multi-energy storage performance under different scenarios: (a) Lithium iron phosphate battery energy storage, (b) pumped storage, (c) compressed air energy storage, and (d) hydrogen energy storage. The EES for the renewables scenario focuses on the economic indicators of energy storage. What are energy storage cost metrics? Cost metrics are approached from the viewpoint of the final downstream entity in the energy storage project, ultimately representing the final project cost. This framework helps eliminate current inconsistencies associated with specific cost categories (e.g., energy storage racks vs. energy storage modules). How does LCoS measure the economy of energy storage? LCOS measures the economy of energy storage by calculating the unit power cost, which is simple to calculate, but it does not fully consider the time value of electricity and the dynamic change in cost, so it is easy to underestimate the long-term operating cost. Will additional storage technologies be added? Additional storage technologies will be added as representative cost and performance metrics are verified. The interactive figure below presents results on the total installed ESS cost ranges by technology, year, power capacity (MW), and duration (hr). Cost should include all real costs associated with design, construction, and operation of the energy storage project. This does not include the cost of charging electricity that is later returned to the grid but should include round-trip efficiency (RTE) losses. Cost should include all real costs associated with design, construction, and operation of the energy storage project. This does not include the cost of charging electricity that is later returned to the grid but should include round-trip efficiency (RTE) losses. As a result, new utility-scale storage capacity is being planned and installed at unprecedented levels, including to install 13.3 GW/43.2 GWh in 2023, a 22% year-over-year increase from 2022.
