Why is shared energy storage system important? Shared energy storage system ensures the economic feasibility of all participants. With the rapid development of distributed renewable energy, energy storage system plays an increasingly prominent role in ensuring efficient operation of power system in local communities. How to create a shared energy storage community? Community setup The first step to have shared energy storage is to form communities which are built by using the k -means approach. The geographical locations (longitude and latitude) are used to cluster the households. In this case, $K = 3$ is used to form three communities due to the distance limitation of CES and the road intersection. Does a shared storage system have a complementarity of power generation and consumption? In this context, considering the complementarity of power generation and consumption behavior among different prosumers, this paper proposes an energy storage sharing framework towards a community, to analyze the investment behavior for shared storage system at the design phase and energy interaction among participants at the operation phase. How does storage sharing work? Under the storage sharing mode in which users invest in storage equipment individually and share their idle storage capacities within the community, the optimal energy storage size is determined by the genetic algorithm . However, the energy trading process is fixed, which may reduce users' cost savings. What are the four types of energy storage technologies? This marks the first domestic shared storage demonstration project to integrate four types of new energy storage technologies--lithium iron phosphate, sodium-ion, vanadium flow, and flywheel storage--signaling a transformative step toward high-quality construction and efficient utilization of storage systems. Are shared energy storage rates correlated with shared charging/discharging power? In the shared energy storage mechanism proposed in this paper, the contribution rates of all prosumers are positively correlated with their shared charging/discharging power, that is, the greater the shared charging/discharging power, the more the cost-saving of prosumers.
