

This review paper aims to provide a comprehensive overview of the recent advances in lithium iron phosphate (LFP) battery technology, encompassing materials development, electrode engineering, electrolytes, cell design, and applications. Lithium iron phosphate (LFP) batteries have emerged as one of the most promising energy storage solutions due to their high safety, long cycle life, and environmental friendliness. In recent years, significant progress has been made in enhancing the performance and expanding the applications of LFP. The cooling methods considered for the LFP include pure air and air coupled with phase change material (PCM). We obtained the heat generation rate of the LFP as a function of discharge time by fitting experimental data. Numerical simulation results indicated that air cooling is only appropriate for Thermal runaway and explosion propagation characteristics of large lithium iron phosphate battery for energy storage station 1.
