Can a robot use energy as a power source? As a power source, we consider every possible source of energy that can be utilized by a robot to perform mechanical work, including forms of energy storage that can be introduced as secondary power sources or regenerative intermediate storage systems. Are batteries a viable energy source for robotic Power Systems? The aim of the study is to analyze the state of the art and to identify the most important directions for future developments in energy sources of robotic power systems based mainly on batteries. The efficiency and performance of the battery depends on the design using different materials. What are mobile robot energy sources? Energy Storage and Battery Technologies The main mobile robot energy sources are rechargeable batteries which are made from different materials. For the best performance, low weight, high current draw capability, and high capacity are required. Are battery power systems based mainly on different materials for mobile robots? 6. Conclusions In this paper, power systems based mainly on batteries from different materials for mobile robots were presented. Different energy sources were considered, and a detailed analysis of the electrical sources was performed. This can be summarized as follows: Can embodied energy power be used in robots? Integrating energy power into these flexible mechanisms can largely improve power endurance and reduce the overall weight. However, conventional structural batteries can hardly withstand large deformation and dynamic loads, leaving a great challenge to design embodied flexible energy power for robots with flexible and deployable structures. How to choose a power supply for a mobile robot? Selecting a power supply for a mobile robot begins with determining a list of components that require power. Those components should be then grouped by the type of power they require, namely, mechanical, electrical, pneumatic, and hydraulic. Within those groups, a second level of grouping is necessary--by the required power supply parameters.
