Are abandoned mine shafts a key problem in China's Energy Storage Technology? However, studies on basic theories and key technologies are a pressing issue. Six key scientific problems have been identified in PSH development in abandoned mine shafts that are relevant to China's national conditions, current resource structure, and relative status of energy storage technologies in China and other countries. Are abandoned mines available energy storage facilities? Therefore, abandoned mines can be defined as available energy storage facilities for addressing the spatio-temporal intermittency and imbalance of renewable energy generation (7). Can abandoned mine shafts be used to solve the construction problem? Considerable resources can be tapped from abandoned mine shafts to reap economic benefits. They offer new pathways for innovation in energy exploitation and utilization and developing new types of power systems. In a word, abandoned mine shafts can be used to solve the "construction" problem as opposed to the "destruction" problem mentioned above. Can underground space energy storage technology be used in abandoned coal mines? The underground space resources of abandoned coal mines in China are quite abundant, and the research and development of underground space energy storage technology in coal mines have many benefits. Can pumped storage be used in abandoned mines? Many countries in the world have already begun to study the pumped storage of underground reservoirs in abandoned mines. For example, in , the Niedersachsen State Energy Research Institute in Germany planned to use the Grund abandoned gold mine roadway in Upper Harz region to build an all-underground pumped storage power station . Does China have a 'secondary development' in abandoned mines? In China, the concept of "secondary development" is not strong in abandoned mines. Most mines use "closed" and "backfill" to enclose the roadway, which not only wastes a lot of underground space, but also brings great challenges to the subsequent mining work. The share of new energy in China's energy consumption structure is expanding, posing serious challenges to the national grid's stability and reliability. As a result, it is critical to construct large-scale reliable energy storage. Renewable energy in China's abandoned mines The topology of coal mines makes them particularly well matched to the needs of pumped-storage power stations--the most widespread and advanced method of storing electricity and adjusting voltages (11). Smart microgrid construction in abandoned mines based on The gravity energy storage system principle, system structure, subsurface powerhouse, underground storage, and transit system are all examined and analyzed. The viability of Research progress and key technology of abandoned mine Gravity energy storage is recognized as a novel strategy for its high efficiency, environmental sustainability, exceptional stability, and large-scale energy storage capacity, as confirmed by China's Abandoned Mines to Power Energy By repurposing abandoned mines, MTES systems offer a sustainable and efficient solution for seasonal energy storage, addressing the intermittent nature of renewable energy sources. This innovation could significantly Smart microgrid construction in abandoned mines based on Based on this, this paper proposes an abandoned mine smart microgrid system based on gravity energy storage technology's technical advantages and combining it with abandoned mines China's Abandoned Mines Become
