What are the advantages of a standalone energy storage system?The high-temperature heat stored in particle TES can generate power by a high-efficiency power cycle. The standalone ETES for electricity storage has advantages of greater flexibility in site selection than a CSP plant or other large-scale energy storage methods such as compressed air energy storage (CAES) or pumped storage hydropower (PSH). What is a SoC-dependent energy storage model?We first define an SoC-dependent energy storage model in which the power rating, efficiency, and discharge cost depend on storage SoC. We describe how to incorporate SoC-dependent energy storage model into multi-period optimizations, which we will use as a benchmark for comparison. Can a multi-period model be used to dispatch energy storage in real-time?Although in the-ory power system operators can use multi-period models to dispatch energy storage in real-time using a look-ahead dispatch setting, this only applies to dispatch decisions from the first time period and repeats the dispatch optimization with updated system states and prediction horizon. Which market model is best suited for energy storage?In terms of market design, we consider three market models: Multi: the energy storage is not constrained by the market bidding model and can freely make charge and discharge decisions to arbitrage price differences. This case represents the best possible arbitrage results and adopts the optimization multi-period dispatch model (1). What is energy storage system?The storage system is designed in a modular configuration, which consists of energy storage components and power-related components. Energy storage uses particle-based TES, and the particles are transported by skip hoists. Why do we need longer duration energy storage?The installed storage infrastructure is therefore highly utilized. To substitute baseload power with significant renewable penetration to the grid, longer duration energy storage between 10 hours and 100 hours may be needed to overcome the electricity supply/demand deficits due to weather events.
