What is a smart grid? Smart grid is a large 'System of Systems', where each functional domain consists of three layers: (i) the power and energy layer, (ii) the communication layer, and (iii) the IT/computer layer. Layers (ii) and (iii) above are the enabling infrastructure that makes the existing power and energy infrastructure 'smarter'. What are smart grid operations? Metering, recording, and controlling operations come under the purview of the smart grid operations. Real-time information exchange with the power market needs to be established in order to implement power trading and scheduling. The operators need to interact with various service providers for ensuring proper functioning of the smart grid. How to develop a smart grid power market? Smart grid power market needs to develop, keeping in mind all the objectives of the smart grid. The communication infrastructure integrating the bulk generation, transmission, distribution, consumers, markets, and service providers is the key to the success of the power market in a smart grid. Why is communication infrastructure important for smart grid operations? Proper communication infrastructure will be required for the consumers to interact with the operators, distribution systems, and the market. Smart grid operations require communication interface with the bulk generating facilities, transmission system, substation automation, distribution automation, DMS, consumers, and the market. What are grid-friendly appliances? Grid-friendly appliances. Voltage and frequency-sensing appliances will assist in stabilizing the grid following a disturbance, enable demand response. Example: appliances, such as heaters, air conditioners, washing machines, dryers etc. can be switched on or off to shave peak load or fill valley load. What are the key enablers of Smart Distribution Systems? Substation automation and distribution automation will be the key enablers for the smart distribution systems. Increasing use of distributed energy resources (DERs) will be an important feature of future distribution systems. Distribution system operator typically controls the distribution system remotely.
