

What is the difference between rated power capacity and storage duration? Rated power capacity is the total possible instantaneous discharge capability (in kilowatts [kW] or megawatts [MW]) of the BESS, or the maximum rate of discharge that the BESS can achieve, starting from a fully charged state. Storage duration is the amount of time storage can discharge at its power capacity before depleting its energy capacity. What are the KPIs of a battery system? For battery systems, Efficiency and Demonstrated Capacity are the KPIs that can be determined from the meter data. Efficiency is the sum of energy discharged from the battery divided by sum of energy charged into the battery (i.e., kWh in/kWh out). What is a battery energy storage system? A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to provide electricity or other grid services when needed. Does low electricity price affect the discharge capacity of EVs? When considering the charging and discharging pressure of EV users, the discharging pressure decreases due to the low electricity price at 7 h-8 h, resulting in the reduction of the discharge capacity of EVs. It can be observed from Fig. 8 (b) that the discharge capacity of EVs increases at 18 h-19 h. What is storage duration? Storage duration is the amount of time storage can discharge at its power capacity before depleting its energy capacity. For example, a battery with 1 MW of power capacity and 4 MWh of usable energy capacity will have a storage duration of four hours.
