How do photovoltaic anti-backflow systems work? According to different system voltage levels, photovoltaic anti-backflow systems can be divided into single-phase anti-backflow systems, three-phase and energy storage system ones. In a power system, power is generally sent from the grid to the load, which is called forward current. Why should you use an anti-backflow solution for energy storage systems? During the discharge process of industrial and commercial energy storage systems, due to power fluctuations, changes in load power consumption and other reasons, reverse flow of electrical energy may also occur. The anti-backflow solution can effectively avoid this problem and ensure the safe and efficient operation of the energy storage system. Why should I install an anti-backflow prevention solution? There are several reasons for installing an anti-backflow prevention solution: 2.1. Limited by the capacity of the upper-level transformer, users have new grid system installation needs, but it is not allowed locally. 2.2. Due to some regional policies, grid connection is not allowed. Once it is found, the grid company will impose a fine. Does energy storage have a backflow problem? As the scale of global industrial and commercial electricity consumption continues to expand, industrial and commercial energy storage technology has attracted more and more attention. The backflow problem in energy storage systems has always been a problem that troubles users. How does a Deye inverter anti-backflow work? 4. The solution? Deye inverter anti-backflow working principle: install a meter with CT or current sensor at the grid-connected point. When it detects that there is current flowing to the grid, it will feed back to the inverter, and the inverter will immediately change its working mode and track from the maximum power point of MPPT. How to install high-voltage anti-reverse flow detection? Add a high-voltage Meter 3 on the 10kV side of the main transformer to perform high-voltage anti-reverse flow detection function. Meter 3 needs to be connected at the high-voltage side. The high-voltage side wiring construction is difficult and requires dedicated personnel. Brief introduction of anti-backflow device The principle of the anti-backflow controller is to control or cut off the output of the grid-connected inverter by monitoring the input power on the grid side, so that the photovoltaic grid-connected power generation system will not feed the grid.
