What are energy storing and return prosthetic feet? Energy storing and return prosthetic (ESAR) feet have been available for decades. These prosthetic feet include carbon fiber components, or other spring-like material, that allow storing of mechanical energy during stance and releasing this energy during push-off. Are elastic energy storage and return feet effective? Elastic energy storage and return (ESAR) feet have been developed in an effort to improve amputee gait. However, the clinical efficacy of ESAR feet has been inconsistent, which could be due to inappropriate stiffness levels prescribed for a given amputee. What is energy storage and return prosthetics? Preliminary energy storage and return prostheses incorporated an elastically deflectable keel in the prosthetic foot aspect. This design would store a portion of energy during the impact of stance initiation with a subsequent release during the terminal aspect of stance. Do energy storage and return feet affect the propulsion of the body? The effect that energy storage and return feet have on the propulsion of the body: a pilot study. Development of a wearable sensor system for dynamically mapping the behavior of an energy storing and returning prosthetic foot. What are energy storage and return (ESAR) prosthetic feet? 1. Introduction Energy storage and return (ESAR) prosthetic feet are designed to emulate the compliant structures of the anatomical lower-limb via a spring-like construction of carbon fiber. Are energy storing and return (ESAR) feet a good choice? Energy storing and return (ESAR) feet are generally preferred over solid ankle cushioned heel (SACH) feet by people with a lower limb amputation. While ESAR feet have been shown to have only limited effect on gait economy, other functional benefits should account for this preference. Energy storage feet are engineered to harness kinetic energy generated from movement, effectively mitigating the energy expended by users during their activities. When a user walks or runs, the foot absorbs energy at the point of impact with the ground.
